

AMENDMENTS TO SPECIFICATION

Please amend specification paragraph 62 wherein underlining indicates additions, as follows:

[0062] In the preferred embodiment, above the open hole 10 and extending from the contact plate 13 there is a direction control rod 14 which is longer than the contact plate 13. The direction control rod 14 preferably has a generally square-like cross-section with a lower arcing surface but may have nearly any shaped cross-section as will be understood by one having ordinary skill in the art. The control rod 14 is removably insertable into and potentially through a hole 29 of the clamp member 4 in order to control the moving direction of the clamp member 4. The engagement of the control rod 14 with the hole 29 also orients the clamp member 4 relative to the base member 1 and the elastic pad 2 in the assembled condition. The hole 29 extends through the clamp member 4 from a first side 4a to a second side 4b. The first side 4a generally faces the base member 1 in the assembled position and the second side generally faces away from the base member 12 in the assembled position.
